Beatty's Theorem

Def. (Beatty sequence)

For an irrational number $\alpha > 0$, its **Beatty sequence** \mathcal{B}^{α} is given by $\mathcal{B}_{n}^{\alpha} = \lfloor n\alpha \rfloor$.

Beatty's Theorem (Rayleigh 1894, Beatty 1926)

The Beatty sequences of α and β partition the positive integers if and only if $\frac{1}{\alpha} + \frac{1}{\beta} = 1$.

Yuriy Tumarkin

Cutting sequences

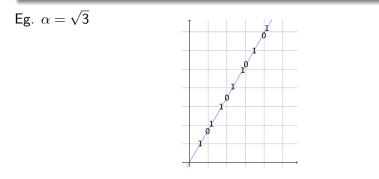

Def. (Cutting sequence)

For a line ℓ with irrational slope $\alpha > 0$, its cutting sequence C^{α} is obtained by writing a 0 for each vertical grid line crossed by ℓ , and a 1 for each horizontal grid line crossed.

Cutting sequences

Def. (Cutting sequence)

For a line ℓ with irrational slope $\alpha > 0$, its cutting sequence C^{α} is obtained by writing a 0 for each vertical grid line crossed by ℓ , and a 1 for each horizontal grid line crossed.

The cutting sequence for $\sqrt{3}$ is 10110110101...

The line of slope $\frac{1}{\alpha}$ is the reflection of the line of slope α in y = x, this reflection swaps horizontals with verticals.

The line of slope $\frac{1}{\alpha}$ is the reflection of the line of slope α in y = x, this reflection swaps horizontals with verticals. Hence:

The cutting sequences for α and $\frac{1}{\alpha}$ are inverse, i.e. one is obtained from the other by the transformation $0 \mapsto 1, 1 \mapsto 0$.

The line of slope $\frac{1}{\alpha}$ is the reflection of the line of slope α in y = x, this reflection swaps horizontals with verticals. Hence:

The cutting sequences for α and $\frac{1}{\alpha}$ are inverse, i.e. one is obtained from the other by the transformation $0 \mapsto 1, 1 \mapsto 0$.

The intersection which gives rise to the *n*th 0 in the cutting sequence has coordinates $(n, n\alpha)$. By this point, the line has crossed $\lfloor n\alpha \rfloor$ horizontal grid lines.

The line of slope $\frac{1}{\alpha}$ is the reflection of the line of slope α in y = x, this reflection swaps horizontals with verticals. Hence:

The cutting sequences for α and $\frac{1}{\alpha}$ are inverse, i.e. one is obtained from the other by the transformation $0 \mapsto 1, 1 \mapsto 0$.

The intersection which gives rise to the *n*th 0 in the cutting sequence has coordinates $(n, n\alpha)$. By this point, the line has crossed $\lfloor n\alpha \rfloor$ horizontal grid lines. Hence:

 \mathcal{B}_n^{α} is given by the number of 1s before the *n*th 0 in \mathcal{C}^{α} .

The line of slope $\frac{1}{\alpha}$ is the reflection of the line of slope α in y = x, this reflection swaps horizontals with verticals. Hence:

The cutting sequences for α and $\frac{1}{\alpha}$ are inverse, i.e. one is obtained from the other by the transformation $0 \mapsto 1, 1 \mapsto 0$.

The intersection which gives rise to the *n*th 0 in the cutting sequence has coordinates $(n, n\alpha)$. By this point, the line has crossed $\lfloor n\alpha \rfloor$ horizontal grid lines. Hence:

 \mathcal{B}_n^{α} is given by the number of 1s before the *n*th 0 in \mathcal{C}^{α} .

Eg. $\alpha = \sqrt{3}$ $\mathcal{C}^{\sqrt{3}}$ 1 0 1 1 0 1 1 0 ... $\mathcal{B}^{\sqrt{3}}$ 1 3 5 6 ...

- (個) - (日) - (日) - (日)

First note that

$$\frac{1}{\alpha} + \frac{1}{\beta} = 1 \iff \alpha + \beta = \alpha\beta \iff (\alpha - 1)(\beta - 1) = 1.$$

(日) (四) (日) (日) (日)

First note that

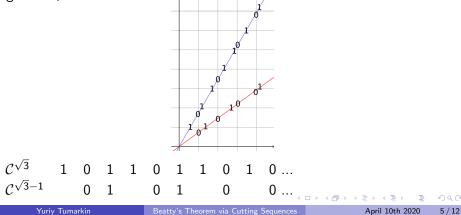

$$\frac{1}{\alpha} + \frac{1}{\beta} = 1 \iff \alpha + \beta = \alpha\beta \iff (\alpha - 1)(\beta - 1) = 1.$$

Observation: we get $C^{\alpha-1}$ from C^{α} by removing a 1 before every 0.

First note that

$$\frac{1}{\alpha} + \frac{1}{\beta} = 1 \iff \alpha + \beta = \alpha\beta \iff (\alpha - 1)(\beta - 1) = 1.$$

Observation: we get $C^{\alpha-1}$ from C^{α} by removing a 1 before every 0. Eg. $\alpha = \sqrt{3}$:

Now compare \mathcal{B}^{α} and $\mathcal{C}^{\alpha-1}$:

A D N A B N A B N A B N

Now compare \mathcal{B}^{α} and $\mathcal{C}^{\alpha-1}$: $\mathcal{C}^{\sqrt{3}}$ 3 6 ... 1 5

Now compare \mathcal{B}^{α} and $\mathcal{C}^{\alpha-1}$: $\mathcal{C}^{\sqrt{3}}$ 1 0 1 1 0 1 1 0 1 0 ... $\mathcal{C}^{\sqrt{3}-1}$ 0 1 0 1 0 0 ... $\mathcal{B}^{\sqrt{3}}$ 1 3 5 6 ... Before the *n*th 0 in \mathcal{C}^{α} , there were $\mathcal{B}^{\alpha}_{\alpha}$ 1s and n-1 0s. S

Before the *n*th 0 in C^{α} , there were \mathcal{B}_{n}^{α} 1s and n-1 0s. So the *n*th 0 of C^{α} is in $\mathcal{B}_{n}^{\alpha} + n$ th place.

Now compare \mathcal{B}^{α} and $\mathcal{C}^{\alpha-1}$: $\mathcal{C}^{\sqrt{3}}$ 1 0 1 1 0 1 1 0 1 0 ... $\mathcal{C}^{\sqrt{3}-1}$ 0 1 0 1 0 0 ... $\mathcal{B}^{\sqrt{3}}$ 1 3 5 6 ... Before the *n*th 0 in \mathcal{C}^{α} , there were \mathcal{B}^{α}_{n} 1s and n-1 0s. So the *n*th 0 of \mathcal{C}^{α} is in $\mathcal{B}^{\alpha}_{n} + n$ th place. So if we remove n 1s before this 0, we get:

 \mathcal{B}^{α} is given by the positions of 0s in $\mathcal{C}^{\alpha-1}$.

Now compare \mathcal{B}^{α} and $\mathcal{C}^{\alpha-1}$: $\mathcal{C}^{\sqrt{3}}$ 1 0 1 1 0 1 1 0 1 0 ... $\mathcal{C}^{\sqrt{3}-1}$ 0 1 0 1 0 0 ... $\mathcal{B}^{\sqrt{3}}$ 1 3 5 6 ... Before the *n*th 0 in \mathcal{C}^{α} , there were \mathcal{B}^{α}_{n} 1s and n-1 0s. So the *n*th 0 of \mathcal{C}^{α} is in $\mathcal{B}^{\alpha}_{n} + n$ th place. So if we remove n 1s before this 0, we get:

 \mathcal{B}^{α} is given by the positions of 0s in $\mathcal{C}^{\alpha-1}$.

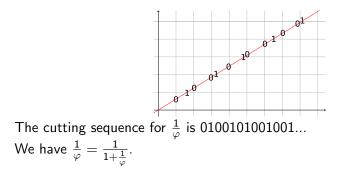

And so

 $\mathcal{B}^{\alpha}, \mathcal{B}^{\beta} \text{ partition } \mathbb{N} \iff \mathcal{C}^{\alpha-1} \text{ and } \mathcal{C}^{\beta-1} \text{ are inverse}$

$$\iff (\alpha - 1)(\beta - 1) = 1$$

 $\iff \frac{1}{\alpha} + \frac{1}{\beta} = 1$

010 pl The cutting sequence for $\frac{1}{10}$ is 0100101001001... We have $\frac{1}{\varphi} = \frac{1}{1 + \frac{1}{\varphi}}$. To get from $\mathcal{C}^{\frac{1}{\varphi}}$ to $\mathcal{C}^{1+\frac{1}{\varphi}}$, we add a 1 before each 0, $0 \mapsto 10, 1 \mapsto 1$. To get to $\mathcal{C}^{\frac{1}{1+\frac{1}{\varphi}}}$, we invert, $0 \mapsto 1, 1 \mapsto 0$.

01 The cutting sequence for $\frac{1}{\varphi}$ is 0100101001001... We have $\frac{1}{\varphi} = \frac{1}{1+\frac{1}{1+\frac{1}{1+1}}}$. To get from $\mathcal{C}^{\frac{1}{\varphi}}$ to $\mathcal{C}^{1+\frac{1}{\varphi}}$, we add a 1 before each 0, $0 \mapsto 10, 1 \mapsto 1$. To get to $\mathcal{C}^{\frac{1}{1+\frac{1}{\varphi}}}$, we invert, $0 \mapsto 1, 1 \mapsto 0$. So $\mathcal{C}^{\frac{1}{\varphi}}$ is invariant under:

$$0\mapsto 01$$

 $1\mapsto 0$

The 0th Fibonacci word, S_0 , is 0. S_n is obtained from S_{n-1} by the substitution

 $egin{array}{c} 0 \mapsto 01 \ 1 \mapsto 0 \end{array}$

U_n	0	2	5	7	10	13

We can also construct the sequences as follows:

- L_n is the lowest positive integer that hasn't appeared in either (L_n) or (U_n) yet.
- $U_n = L_n + n$.

メポト イヨト イヨト ニヨ

Now consider the Beatty sequences of φ and φ^2 .

3

→ ∃ →

• • • • • • • • • •

Now consider the Beatty sequences of φ and φ^2 . Since $\frac{1}{\varphi} + \frac{1}{\varphi^2} = 1$, they partition \mathbb{N} .

3

< ∃ >

Now consider the Beatty sequences of φ and φ^2 . Since $\frac{1}{\varphi} + \frac{1}{\varphi^2} = 1$, they partition \mathbb{N} . And as $\varphi^2 = \varphi + 1$, $\lfloor n\varphi^2 \rfloor = \lfloor n\varphi \rfloor + n$.

< 冊 > < Ξ

Now consider the Beatty sequences of φ and φ^2 . Since $\frac{1}{\varphi} + \frac{1}{\varphi^2} = 1$, they partition \mathbb{N} . And as $\varphi^2 = \varphi + 1$, $\lfloor n\varphi^2 \rfloor = \lfloor n\varphi \rfloor + n$. So we can construct te Beatty sequences in the same way as the Wythoff sequences:

• \mathcal{B}_n^{φ} is the lowest positive integer that hasn't appeared in either \mathcal{B}^{φ} or \mathcal{B}^{φ^2} yet.

•
$$\mathcal{B}_n^{\varphi^2} = \mathcal{B}_n^{\varphi} + n$$

Now consider the Beatty sequences of φ and φ^2 . Since $\frac{1}{\varphi} + \frac{1}{\varphi^2} = 1$, they partition \mathbb{N} . And as $\varphi^2 = \varphi + 1$, $\lfloor n\varphi^2 \rfloor = \lfloor n\varphi \rfloor + n$. So we can construct te Beatty sequences in the same way as the Wythoff sequences:

• \mathcal{B}_n^{φ} is the lowest positive integer that hasn't appeared in either \mathcal{B}^{φ} or \mathcal{B}^{φ^2} yet.

•
$$\mathcal{B}_n^{\varphi^2} = \mathcal{B}_n^{\varphi} + n$$

So, since $L_1 = 1 = \mathcal{B}_1^{\varphi}$,

Now consider the Beatty sequences of φ and φ^2 . Since $\frac{1}{\varphi} + \frac{1}{\varphi^2} = 1$, they partition \mathbb{N} . And as $\varphi^2 = \varphi + 1$, $\lfloor n\varphi^2 \rfloor = \lfloor n\varphi \rfloor + n$. So we can construct te Beatty sequences in the same way as the Wythoff

sequences:

• \mathcal{B}^{φ}_n is the lowest positive integer that hasn't appeared in either \mathcal{B}^{φ} or \mathcal{B}^{φ^2} yet.

•
$$\mathcal{B}_n^{\varphi^2} = \mathcal{B}_n^{\varphi} + n$$

So, since $L_1 = 1 = \mathcal{B}_1^{\varphi}$,

$$L_{n} = \mathcal{B}_{n}^{\varphi} = \lfloor n\varphi \rfloor$$
$$U_{n} = \mathcal{B}_{n}^{\varphi^{2}} = \lfloor n\varphi^{2} \rfloor.$$
